

CONTENT DELIVERY NETWORK

Delivering content faster, closer, and more reliably to users everywhere

What Is a CDN?

A Content Delivery Network is a geographically distributed group of servers that work together to deliver web content quickly to users based on their location.

Instead of every request traveling to one origin server, a CDN caches copies of content on edge servers positioned close to end users.

Key idea: reduce the physical distance between content and the user, cutting latency and load times.

How a CDN Works

A simplified request flow

1. User Request

A visitor requests a page or asset from your website.

2. Nearest Edge

The request is routed to the closest CDN edge server (PoP).

3. Cache Check

If cached, content is served instantly from the edge.

4. Origin Fetch

If not cached, the edge fetches it once from the origin server.

Key Benefits

Faster Load Times

Content served from nearby edge servers cuts round-trip latency.

Scalability

Absorbs traffic spikes and viral surges without overloading origin.

Improved Security

DDoS mitigation, WAF, and TLS termination at the edge.

Reduced Origin Load

Caching offloads the majority of requests from origin servers.

Global Reach

Consistent performance for users regardless of location.

High Availability

Redundant edge nodes keep content online during outages.

CDN Architecture

Origin holds the source of truth; edge PoPs cache and serve copies regionally.

Common Use Cases

Video Streaming

Smooth playback and adaptive bitrate delivery for large audiences.

E-Commerce

Fast page loads that improve conversion and reduce cart abandonment.

SaaS & Web Apps

Low-latency delivery of static assets and API responses.

Software Downloads

Reliable, high-throughput distribution of large files and updates.

**Closer to Users.
Faster for Everyone.**

Thank you
